

ICE MELTER

GRANULAR ALL-TEMPERATURE ICE MELTER

ICE MELTER can dissolve snow and ice in minutes even when temperatures dip below 0°F. Distribute ICE MELTER evenly on concrete or asphalt surfaces using a spreader. Or, simply use your hand and toss ICE MELTER pellets about the ground. ICE MELTER is non-caustic to skin so it won't harm or irritate bare hands. Unlike other deicing products, ICE MELTER won't leave behind a residue that can be tracked onto carpets and floors. So as to not over apply and waste pellets, Share's ICE MELTER comes in a fluorescent green color making it easier to see against glaring ice and snow. ICE MELTER will not chip concrete or asphalt surfaces and won't harm plant life. So when you need to remove ice quickly, efficiently and safely, get ICE MELTER.

DIRECTIONS

All ice melting compounds are impractical to use when snow accumulates to amounts of more than two inches. Before using ICE MELTER be sure to shovel or plow away excess snow, and apply ICE MELTER only to the remaining, hard packed snow. ICE MELTER should be spread at the rate of 1/4 pound per square yard. DO NOT overspread ICE MELTER. Be sure that it is spread evenly and that there are no piles.

ICE MELTER does not harm good quality concrete. It may, however, cause some surface scaling of poor quality concrete. ICE MELTER should not be used on concrete less than one year old and should not be used on concrete with exposed aggregate, precast steps. ICE MELTER should not be used on chipped or cracked concrete, or brick steps or walks.

Water produced by ice and snow that has melted can enter the pores of concrete, or through chips and cracks in the concrete. The alternating freezing and thawing of this water can then cause damage to the concrete. To prevent this from occurring, REMOVE SLUSH AND WATER FROM CONCRETE.

WARNING - HARMFUL IF SWALLOWED

Contains magnesium chloride. If swallowed, give water, induce vomiting and call a physician.
